

Nimbus Cloud Storage - Product Manual

Overview

Nimbus is an object storage service for teams. Files are stored in buckets, and every bucket belongs to exactly one project. Each object can be up to 5 TB in size. Objects larger than 100 MB should be uploaded with multipart upload, which splits the file into parts of 8 MB to 512 MB that are uploaded in parallel.

Storage Classes

Nimbus offers three storage classes. Hot storage costs \$0.023 per GB per month and is designed for frequently accessed data. Cool storage costs \$0.010 per GB per month and has a minimum storage duration of 30 days. Archive storage costs \$0.002 per GB per month, has a minimum duration of 180 days, and retrieval takes up to 12 hours.

Versioning

When versioning is enabled on a bucket, Nimbus keeps every version of an object. Deleting an object adds a delete marker instead of removing data, so previous versions can be restored. Lifecycle rules can automatically delete non-current versions after a chosen number of days.

Encryption

All objects are encrypted at rest with AES-256 by default. Customers on the Business plan can supply their own keys through the Nimbus Key Vault. Data in transit is protected with TLS 1.3, and connections using TLS versions older than 1.2 are rejected.

Rate Limits

Each bucket supports up to 3,500 write requests and 5,500 read requests per second per prefix. Clients that exceed the limit receive HTTP 429 responses and should retry with exponential backoff starting at 100 milliseconds.

Pricing Plans

The Starter plan is free and includes 10 GB of hot storage and 1 GB of daily egress. The Team plan costs \$20 per user per month and includes 1 TB of pooled storage. The Business plan adds customer-managed keys, single sign-on and a 99.99 percent availability SLA.

Support

Starter customers receive community forum support. Team customers get email support with a response time of one business day. Business customers have 24/7 phone support with a one-hour response time for critical incidents.
